

Trust begins with a real person.

Hello, I'm Daniel Martín, co-founder of DNIWallet.

Today, AI can generate increasingly convincing images, voices, and text. Soon, we may no longer be able to tell with certainty whether the person we see or hear is real.

So, what will trust be based on?

This is the challenge Human Link addresses.

Human Link would connect people from different cultures through digital dialogue circles. AI would translate conversations in real time, allowing everyone to speak in their own language.

At the same time, a privacy-preserving digital credential would confirm that a real person is behind each interaction, without exposing unnecessary personal information.

AI would not replace human conversation. It would act as a bridge.

Because detecting machine-generated content will not be enough. We will need spaces where human identity, responsibility, and participation can be trusted.

Human Link is not just about connecting devices.

It is about connecting real people.

Thank you.

Daniel Martín
